

Abstract

Comprehending how the Covid-19 pandemic has spread to 213 of the world's 251 nations and territories requires a comprehensive interdisciplinary effort. This paper looks at the context in which the infection develops and progresses., which includes a global economy, understanding past plagues and pandemics, modern medicine, and government action that is either effective or counter-productive. Exploring the latter means examining how the European Union nations stemmed the tide of the virus and the U.S. with 4.23% of the world population had about a quarter of the cases and deaths.
